Introduction

Here we have an unnumbered introductory chapter with roman-numeral page numbers. This might be a Preface or Introduction, perhaps with Acknowledgments at the end.

Humpty-Dumpty sat on a wall. Humpty-Dumpty had a great fall. All the King's horses and all the King's men couldn't put Humpty together again. Humpty-Dumpty sat on a wall. Humpty-Dumpty had a great fall. All the King's horses and all the King's men couldn't put Humpty together again.

Acknowledgments

I would like to thank The Brothers Grimm and Mother Goose for many helpful discussions and much advice.

1

Getting Started

GNU WHO

This is the first numbered chapter of the book. The following text illustrates what `cslipubs.sty` produces, along with examples of some of the macros in `cslipubs-extra.sty` and `lingmacros.sty`. This sampling is not exhaustive.

1.1 Format of Documents

Please look at `example.tex`, which produced this documentation by using the `cslipubs.sty` package. Note that the `cslipubs.sty` package relies on Melchior Franz's `crop.sty` package, a copy of which accompanies this example.

1.2 DRAFT vs. FINAL

In specifying `\usepackage{cslipubs}`, the options `DRAFT` and `FINAL` are available. The default is `DRAFT`, which is recommended until the book is almost ready for press:

```
\usepackage[DRAFT]{cslipubs}
```

The `DRAFT` option provides the following:

- Each page is centered on $8\frac{1}{2}'' \times 11''$ (USA's standard) paper.
- `\NOTE{ }` may be used for marginal draft comments.
- The date is printed at the top outer corner of each page.

When the book is almost ready for press, change the above `\usepackage` command to:

```
\usepackage[FINAL]{cslipubs}
```

This marginal note demonstrates the `\NOTE{ }` command, which is meant for reminders while using the `[DRAFT]` option.

2 / GNU WHO

The `FINAL` option has the following effects:

- Each page is pushed to the top left corner on a printout (unless a `\crop[]` command is given, which centers each page).
- `\NOTE{ }` is nullified, producing no comments.

1.3 Some Stuff From `lingmacros.sty`

For instance, the following manner of displaying sentences or other kinds of examples of things was originally designed for linguistics documents, and we have found it to be generally useful in other sorts of documents as well.

(1) Peas porridge hot. Peas porridge cold.

And then you can have enumerated items within such an enumerated example.

- (2) a. kalk-n apra kpa-ra
 sago pudding V SG-OBL plate VII PL big-VII PL
 ‘big plates of sago pudding’
- b. pia-ka-timí
 words O-1SG A-say
 ‘I talked.’
- c. na-mpu-wapát-ncut
 3SG O-3PL A-climb-RM PAST
 ‘They climbed it (the tree).’
- d. nan-áwkura-na amtra
 PL IMP-gather-IMP food V PL
 ‘Collect food!’

The enumeration is taken care of automatically. And you can refer to such enumerated examples without having to keep track of or otherwise know which numbers they are assigned using the standard `\label{ }` command or the non-standard `\toplabel{ }` command. Look into the on-line file for this chapter to see how you are able to refer blindly to examples (1), (2). A little bit extra to make sure of enough lines.

1.4 Some More Stuff

You can also produce attribute-value matrices, like this:

$$\begin{bmatrix} \text{alpha} & \text{beta} \\ \text{gamma} & \text{delta} \\ \text{epsilon} & \text{zeta} \end{bmatrix}$$

TABLE 1
Means, Medians, and Ranges of Twenty-four Correlations
Computed on Mean Ranks of Students' Choices Between
the Reference, Schelling, and Salience Tasks
(Experiment 2)

PAIRS OF TASKS	MEAN	MEDIAN	RANGE
Reference and Schelling tasks	.80	.89	0.33–1.00
Reference and salience tasks	.80	.83	0.27–1.00
Schelling and salience tasks	.84	.89	0.21–1.00

And various kinds of proof-trees are possible,¹ though there is a limit to how deeply these things can be embedded:

$$\frac{A \quad \frac{B \wedge C}{D}}{E}$$

However, you might also want to look at the separate `avm.sty` style file by Christopher Manning.

If you want the first line of a block of text following such a display not to be indented, such as when the display occurs in the middle of a paragraph, then write `\noindent` first thing at the start of the block of text.

A table is included here as well. Figures will appear at the tops of pages, and the caption is placed below the figure. Tables also appear at the tops of pages, but the caption is placed above the body of the table.

And we really need to have enough stuff to take us onto another page.

In the late autumn of 1903, Professor R. Blondlot, head of the Department of Physics at the University of Nancy, member of the French Academy, and widely known as an investigator, announced the discovery of a new ray, which he called N ray, with properties far transcending those of the x-rays. Reading of his remarkable experiments, I attempted to repeat his observations, but failed to confirm them after wasting a whole morning. . . .

Fuel was added by a score of other investigators. Twelve papers had appeared in the “Comptes rendus” before the year was out. . . .

By early summer Blondlot had published twenty papers, Charpentier twenty, and J. Becquerel ten, all describing new properties and sources

¹Here is a footnote. Getting these proof trees to look good takes a lot of careful attention.

4 / GNU WHO

of the rays.

Scientists in all other countries were frankly skeptical, but the French Academy stamped Blondlot's work with its approval by awarding him the Lalande prize of 20,000 francs and its gold medal 'for the discovery of the N rays.'

[Excerpts from "N rays" by R. W. Wood, in R. L. Weber, *A Random Walk in Science* (The Institute of Physics, London) 1973. The article was, itself, a condensation of a piece in William Seabrook's *Dr. Wood Modern Wizard of the Laboratory* (Harcourt Brace) 1941. I chose this piece in response to the reports of the discovery "cold fusion" in Utah.]

2

Continuing On

CHRISTINE S. LIPUBS

This will be the second numbered chapter of the book. The following will help to fill up some space.

2.1 Some Stuff Again

One can do definitions, theorems, and so forth, as follows.

Definition 1 (A, C, \cdot) is a *X-form system* if A is a class, $C : A \rightarrow PX$ and for each $a \in A$, if $\sigma : Ca \rightarrow X$ then $\sigma \cdot a \in A$ such that

- $C(\sigma \cdot a) = \{\sigma x \mid x \in Ca\}$,
- $\sigma \cdot a = a$ if $\sigma x = x$ for $x \in Ca$,
- $\sigma' \cdot (\sigma \cdot a) = (\sigma' \circ \sigma) \cdot a$ if $\sigma' : C(\sigma \cdot a) \rightarrow X$

Definition 2 (A, C, \cdot) is a *(elementary) universe* if it is an A -form system.

Theorem 1 *For every ontology U there is a wf (af) U -universe. Moreover it is unique up to isomorphism.*

Proof. Well, the proof is left to the reader. Just follow the definitions and hack it out. \square

Besides definitions and theorems, you can have axioms, lemmas, propositions, examples, and other types of formal mathematical statements.

2.2 Some Other Stuff Again

After L^AT_EXing these files, the indexing information will be recorded in a file `book.idx`. This index data can be massaged into something that can later be included as an index, using the `makeindex` program (ask

FIGURE 1 A Bunch of Overlapping Circles and Some
Other Stuff: An Example of a Figure with
A Long Caption

your local \LaTeX expert about it) plus some hands-on work. The \LaTeX manual explains how this works.

Chapter bibliographies will be produced as References sections by \LaTeX 's BibTeX program in cooperation with the `chapterbib.sty` and `natbib.sty` packages. Check out the corresponding comments in `example.tex` and `natbib.summary` along with the \LaTeX manual. For example, we now cite Kripke 1972, which is completely irrelevant here but demonstrates the bibliography citation mechanism. If nothing else were cited then this chapter's References section would contain just that one entry. Additional entries are included in this chapter's References without being explicitly cited in the text, thanks to the `\nocite{}` command. The file `example-ch02/ch02.bib` has many possible bibliography entries, but only those that are cited (or "nocited") will appear in the References section at the end of this chapter.

Also, an example of a figure is included here. Figures will appear at the tops of pages, and the caption is placed below the figure. Tables also appear at the tops of pages, but the caption is placed above the body of the table.

2.3 Typewriter characters in `cslipubs-extra.sty`

The package `cslipubs-extra.sty` also includes some characters normally unavailable in the typewriter fonts of `\texttt{}` or `\ttfamily`. Any $\text{\$math}$ mode meanings of the following commands are unaffected. Yes, `\sim` and `\tilde` are redundant on purpose.

Command	Character	Example	($\text{\$math}$ mode)
<code>\backslash</code>	<code>\</code>	<code>\</code>	(<code>\</code>)
<code>\caret</code>	<code>^</code>	<code>10^2</code>	none
<code>\lbrace</code>	<code>{</code>	<code>{100</code>	(<code>{100</code>)
<code>\rbrace</code>	<code>}</code>	<code>100}</code>	(<code>100}</code>)
<code>\sim</code>	<code>~</code>	<code>~1</code>	(<code>~ 1</code>)
<code>\tilde</code>	<code>~</code>	<code>~1</code>	(<code>\tilde 1</code>)
